WEATHER SYNOPSIS BY REGION

NORTHERN CALIFORNIA

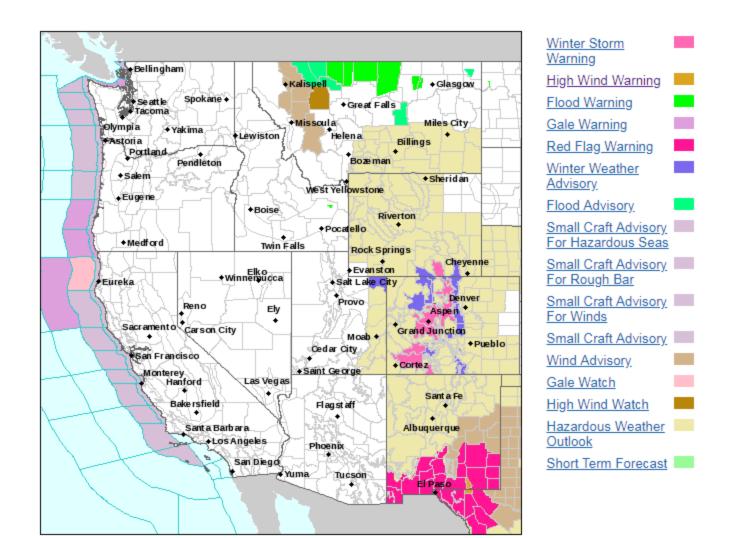

High pressure building in from the eastern Pacific will produce warm and dry weather into the early part of next week. Afternoon temperatures will be 10-15 degrees above normal and minimum afternoon humidity in inland areas will be 10-20%. Northerly winds will gust to 25 mph or so in wind-prone areas from the western Cascade-Sierra slopes to the foothills on the west side of the Sacramento Valley during nights and mornings. The only exception to this pattern is a weak disturbance passing to our north on Sunday that will produce a few more clouds and slightly cooler temperatures. Low pressure dropping in from the Gulf of Alaska will begin to produce more clouds and S-SW winds during the middle of next week, and we'll see an increasing chance of showers from this low later in the week.

SOUTHERN CALIFORNIA

Stratus and fog cover some coastal areas and the Southern San Joaquin Valley early this morning, but expect skies to turn sunny well before noon across all areas. High pressure building over the area will lead to a warming and drying trend with mainly light, diurnal wind patterns. Temperatures will climb 5-8 degrees today and again Saturday. By the weekend, highs will climb into the 60s in the mountains and into the lower 90s across the San Joaquin Valley, the low desert as well as inland valleys of Southern California. Minimum relative humidity will be in the teens for 4-6 hours each day, but light winds and clear skies should allow for good recovery each night. There will be extensive areas of night and morning low clouds along the coast which may spread toward the intermediate valleys by Sunday morning. Quiet and seasonably warm weather will continue into the first half of next week, but long range models indicate a weak cutoff low pressure may bring cooler and breezier weather back to the district next Thursday. Isolated showers may also be possible by then over Central California, but no significant rain or offshore winds are expected the next 7-10 days.
